

ABSTRACT OF THE DISCLOSURE

An image forming apparatus (X) includes a print head (2) provided with a projection (23a) which is offset with respect to a lens (22a) in an secondary scanning direction (CD) and which protrudes beyond the lens (22a) toward the photosensitive recording medium (4) for abutting against the photosensitive recording medium (4). The projection (23a) moving in contact with the photosensitive recording medium (4) during exposure corrects waviness of the photosensitive recording medium (4).
